This garment is designed to protect against brief contact with flames, in the presence of low levels of convective and radiant heat. The device allows the dissipation of electrostatic charges.

As it only offers protection for the part of the body that is actually covered, it must be supplemented with other PPE, depending on its intended use, to protect the hands, legs, feet and head.

Store the garment in its original packaging in a cool, dry place, away from heat sources and protected from light. Before each use, check that the garment is in perfect condition. If it is not intact, replace it.

Carefully follow the instructions on the label and the information provided in the Information Note to keep the garment in good condition.
